

# Configuring Internet Explorer for RPA

- Security Settings
- Privacy – Pop-ups and Extensions in Private Mode
- Zoom Level
- Managing Java Add-ons
- User Account Control Settings

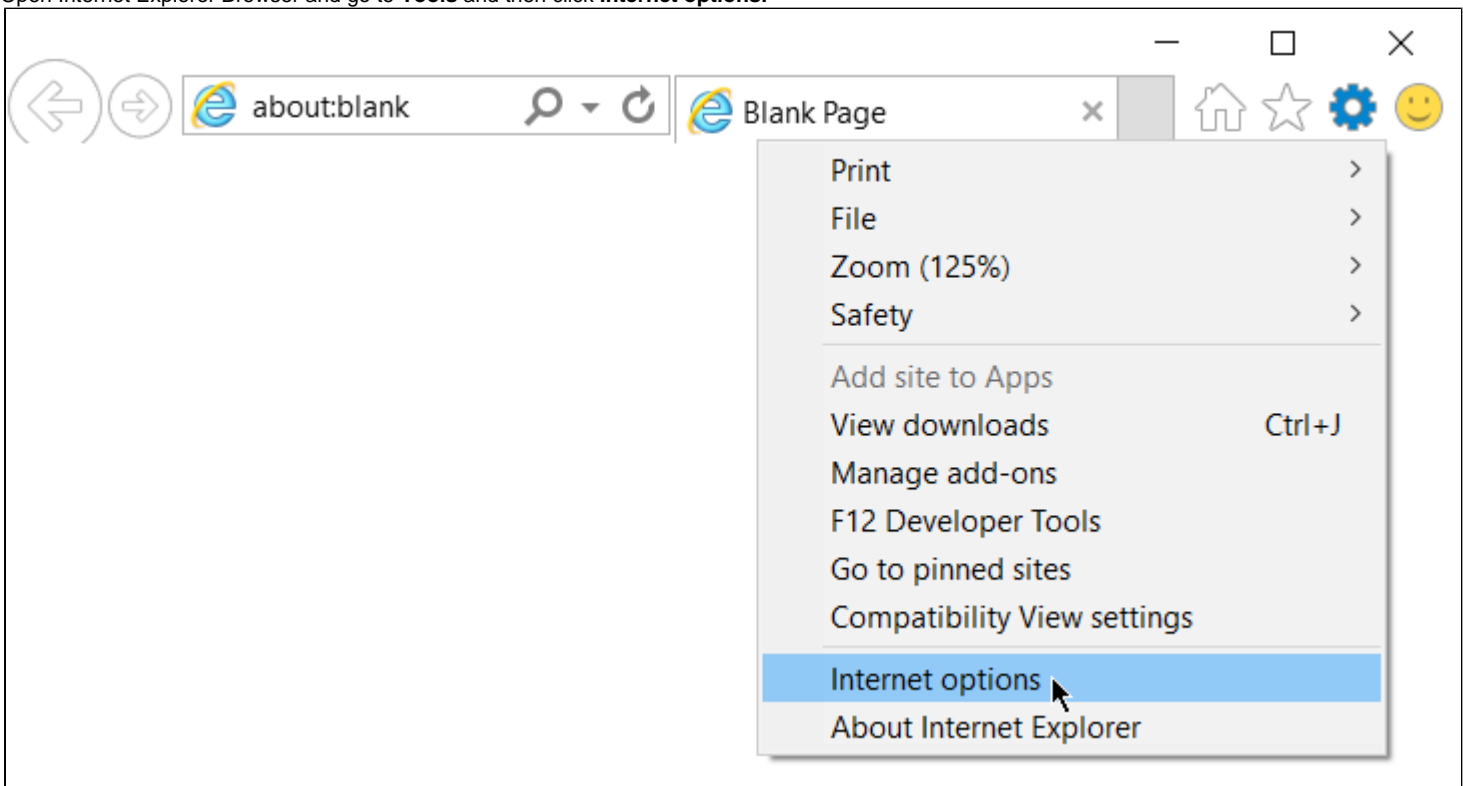

Before making any changes to **Internet Explorer settings**, make sure **no Java processes are running**.

On the previous step, you should have already ran the **settings-ie.reg** file, which delivers all the necessary changes to your *Internet Explorer browser*.

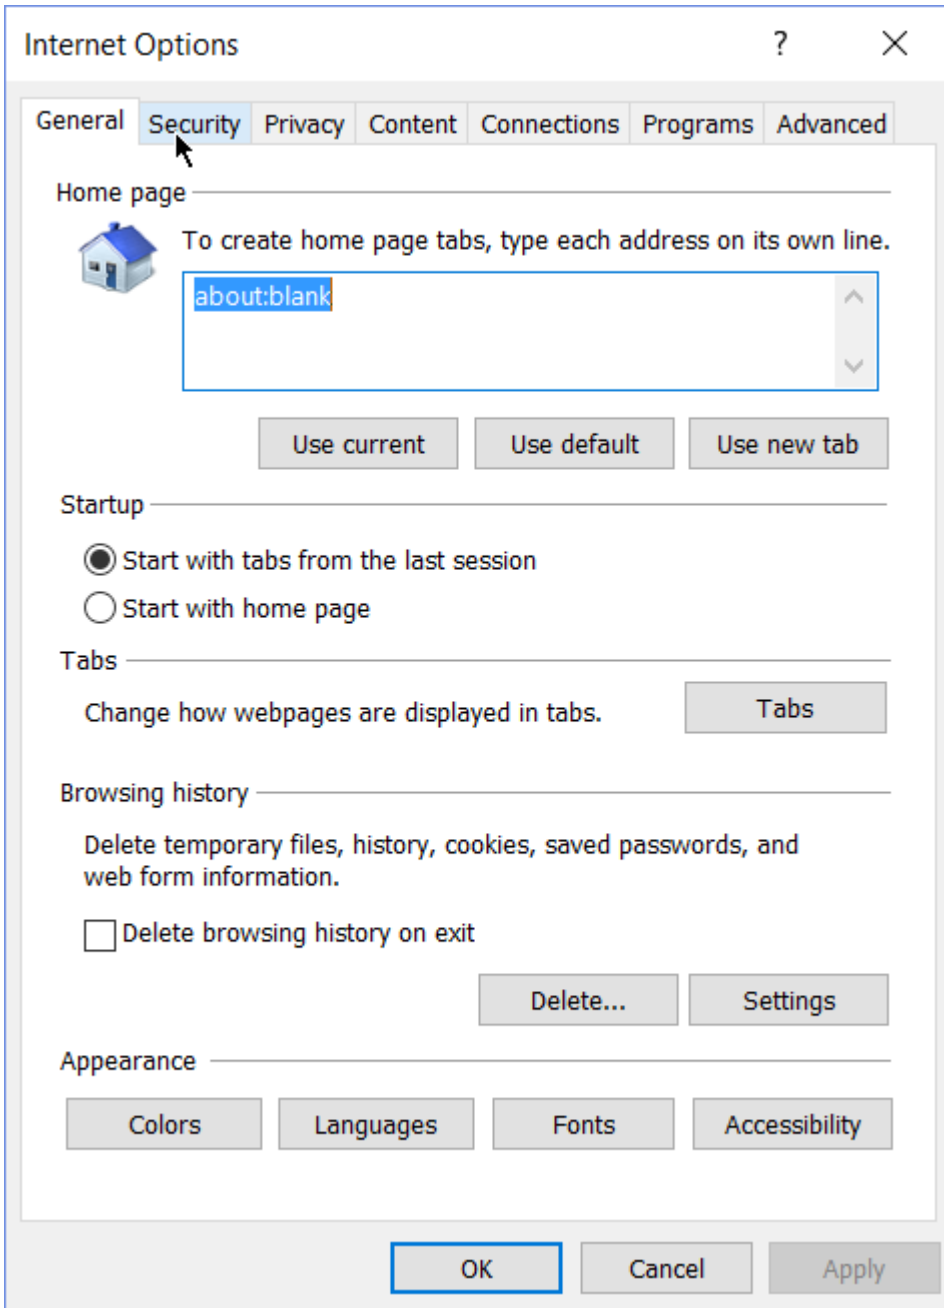

Refer to the screenshots bellow and check that all the settings have been set correctly.

## Security Settings

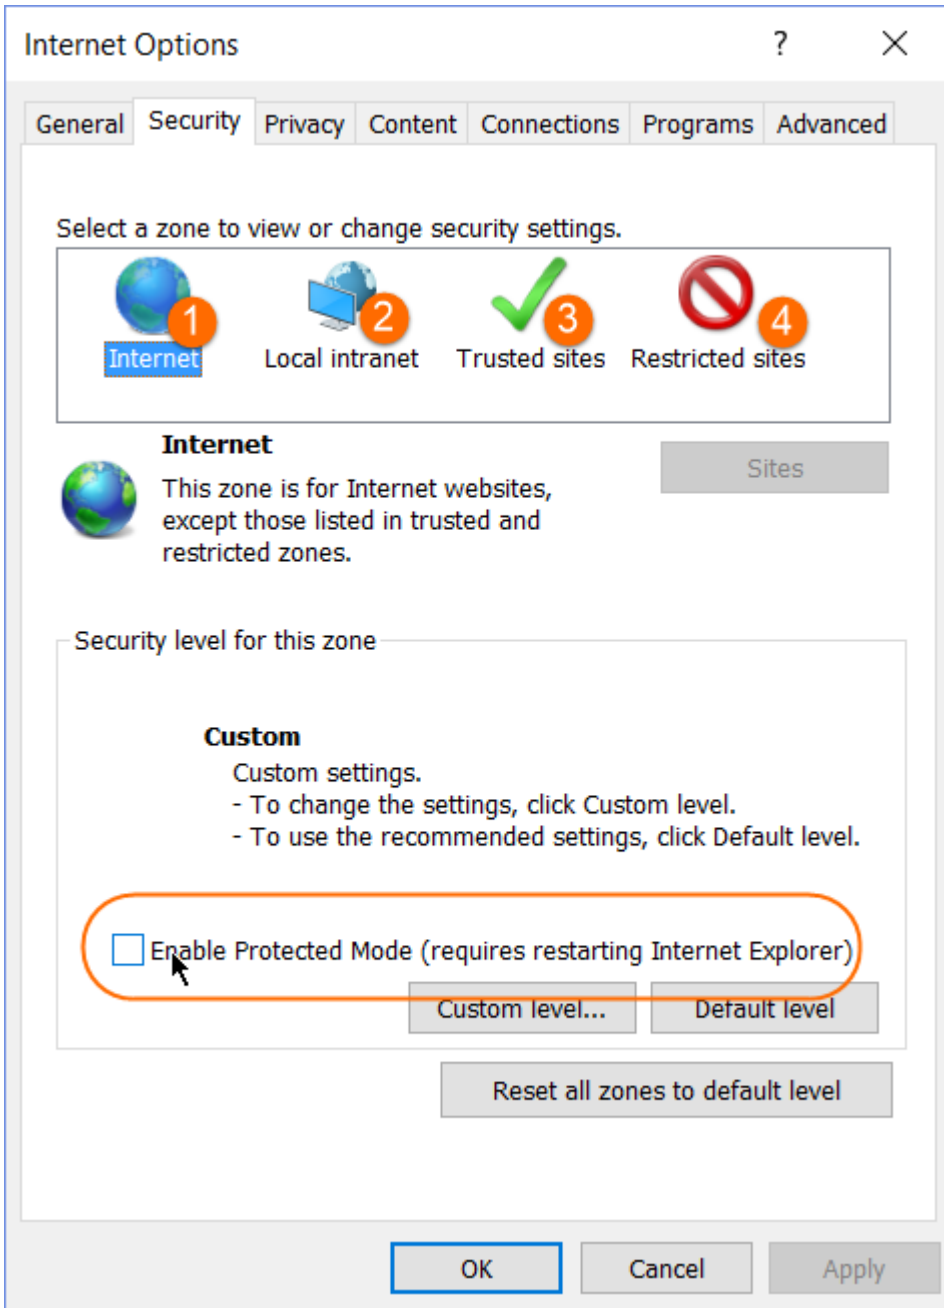

Open Internet Explorer Browser and go to **Tools** and then click **Internet options**:

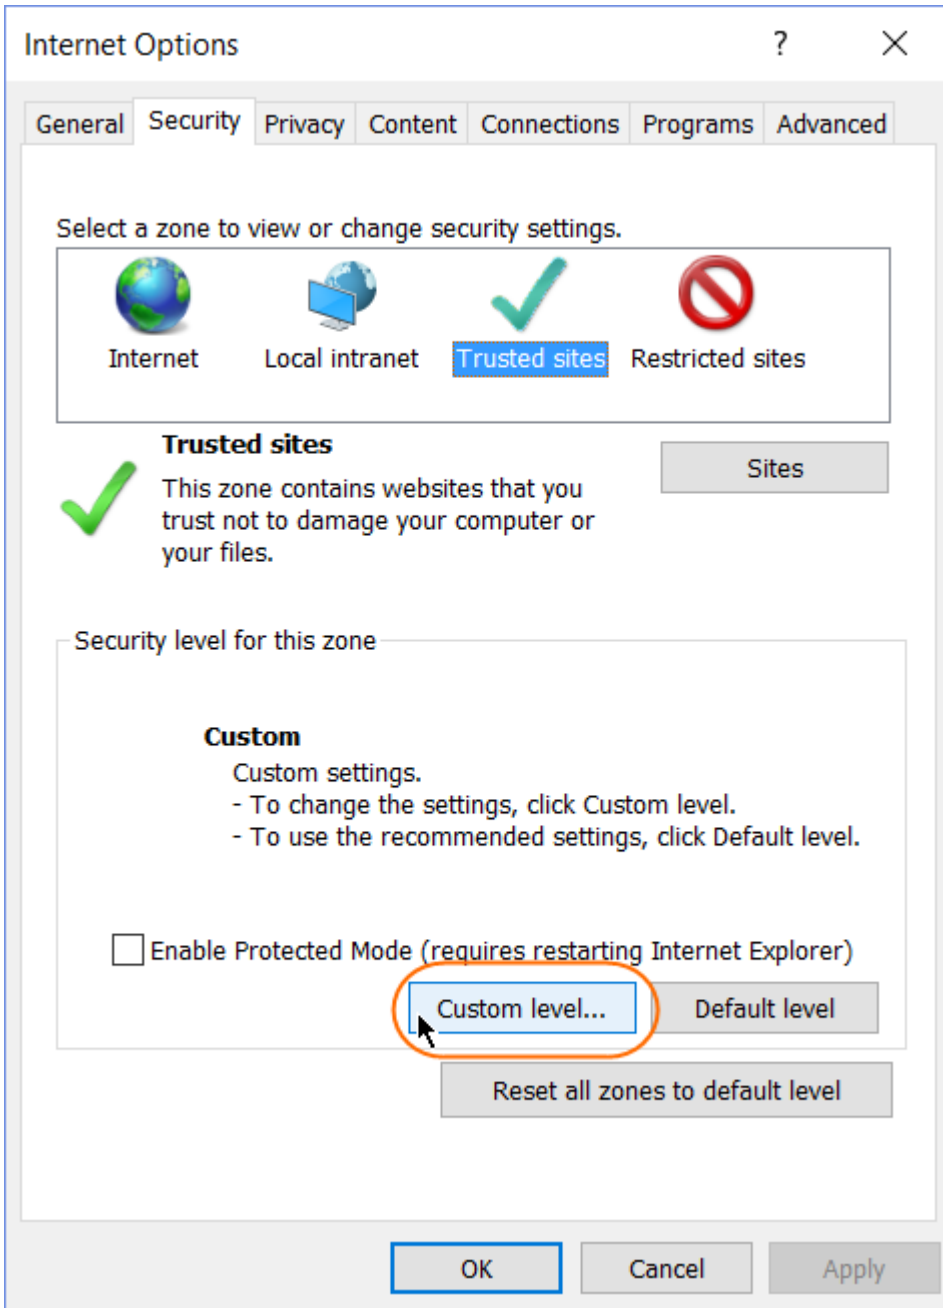

Internet Options dialog appears:

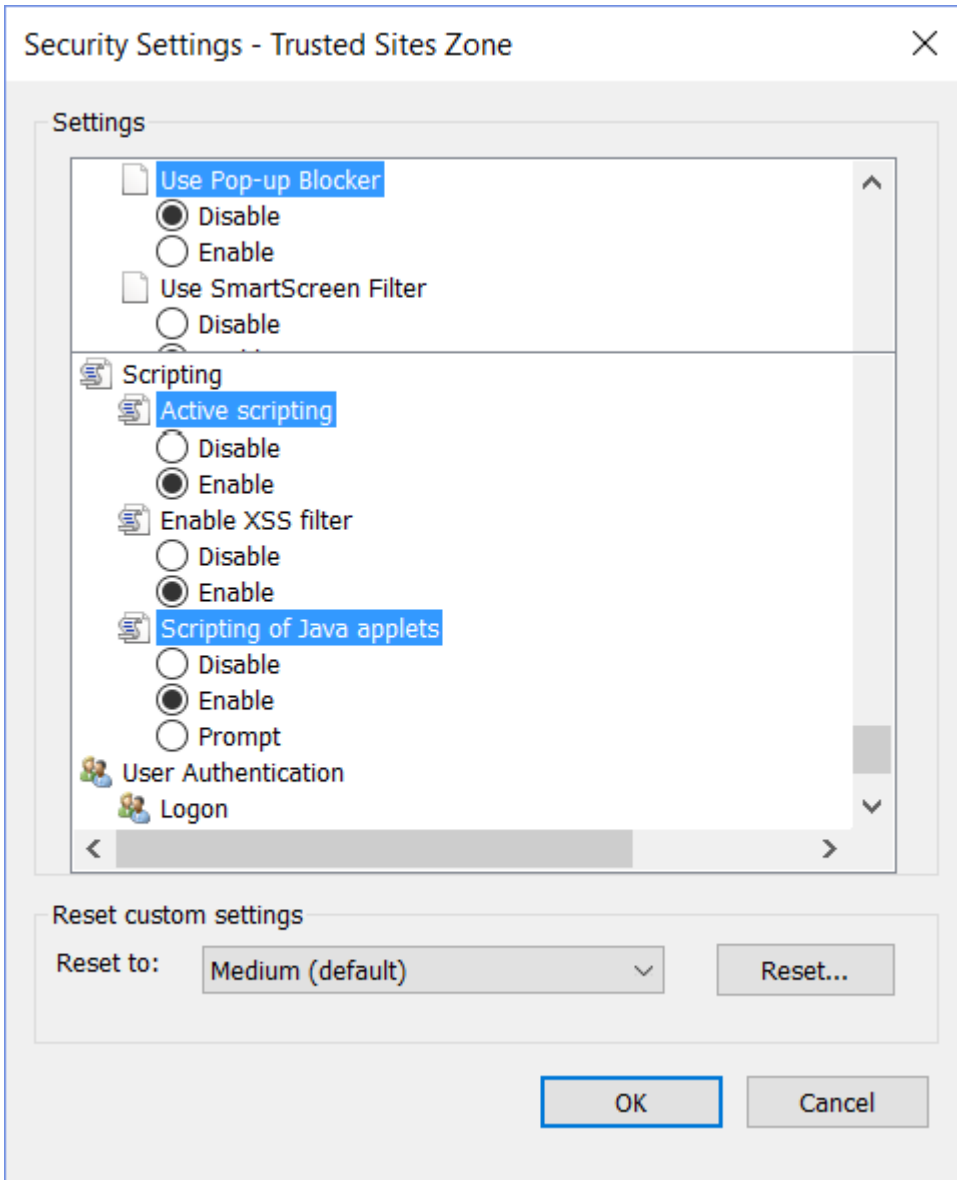

Open **Security** tab and check that **Enable Protected Mode** option is disabled for each security zone:

On **Security** tab, select **Trusted sites** and click the **Custom Level** button:

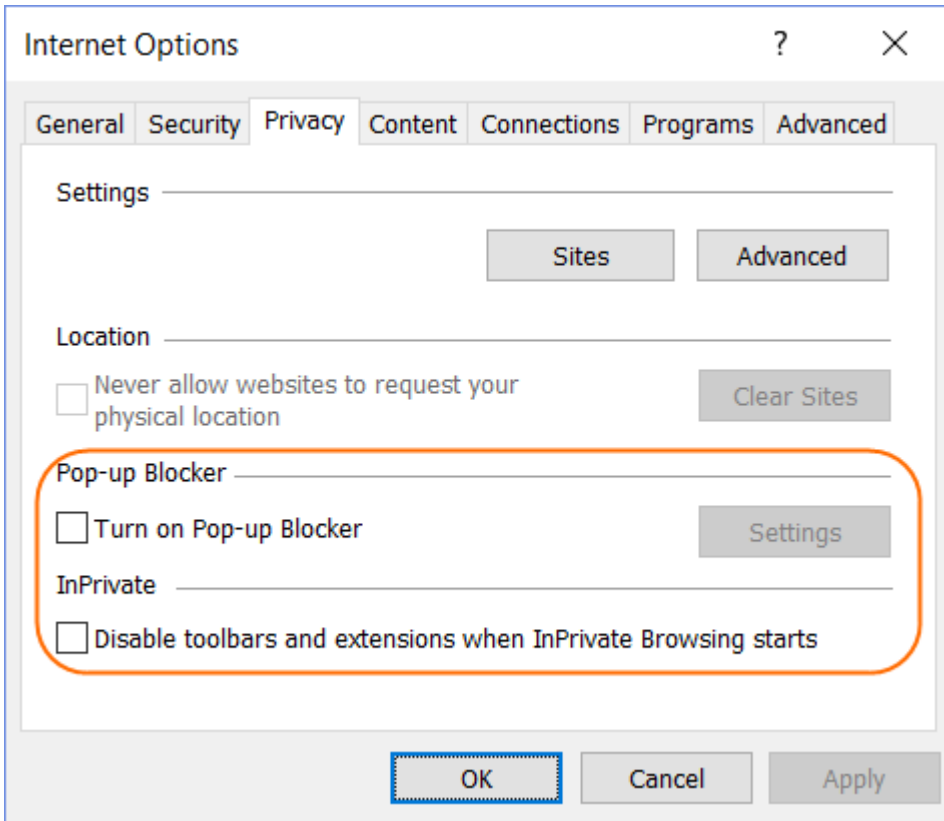

1. Disable the **Use Pop-up Blocker** option
2. Scroll down and check that "**Active scripting**" option is **enabled**
3. Scroll down and check that "**Scripting of Java applets**" option is **enabled**

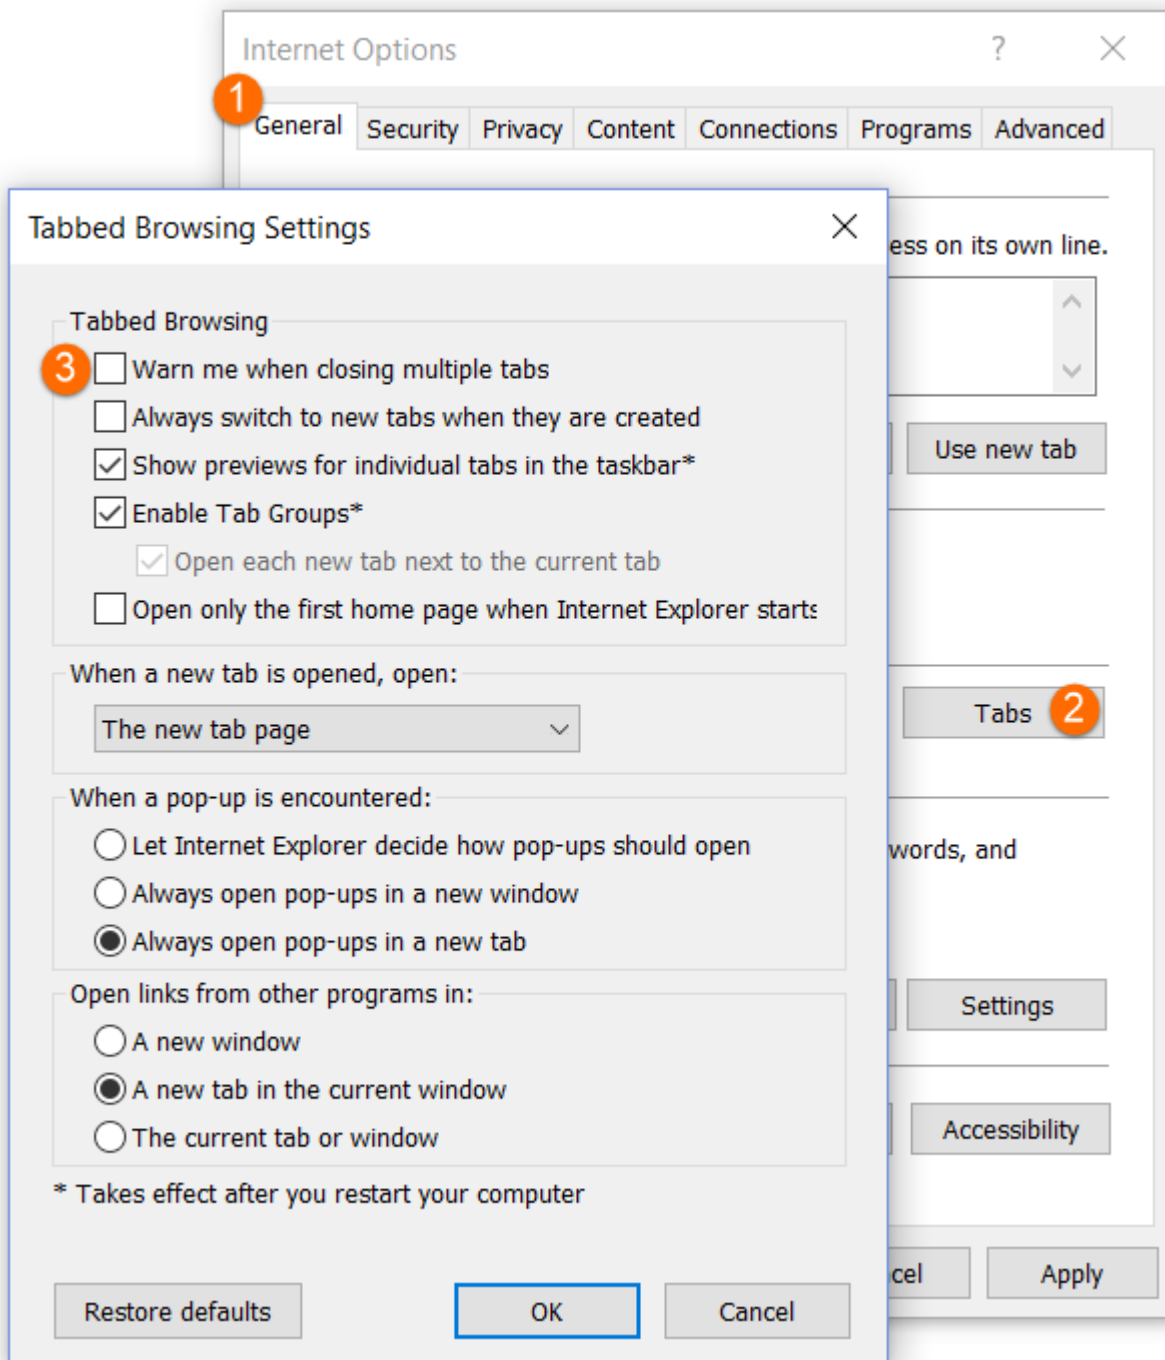

## Privacy – Pop-ups and Extensions in Private Mode

Close Security Settings window. On Internet Options window, switch to the **Privacy** tab.

Options "**Turn on Pop-up Blocker**" and "**Disable toolbars and extensions when InPrivate Browsing start**" should be **disabled**:

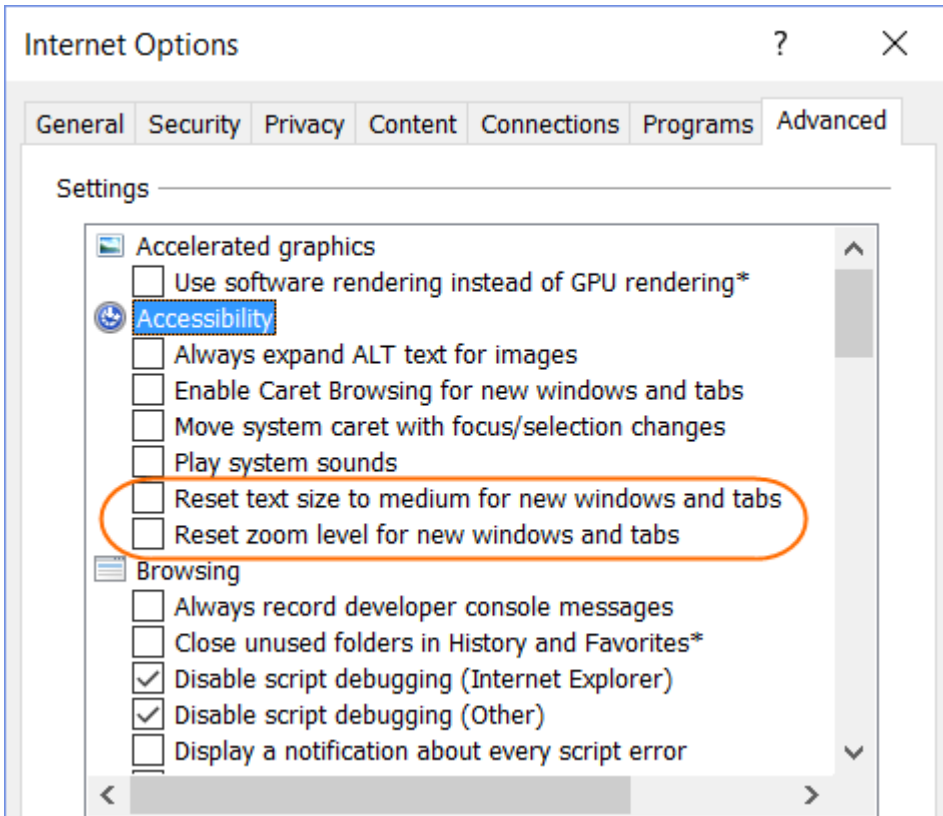

1. Switch to "**General**" tab
2. Click button "**Tabs**"
3. Check that "**Warn me when closing multiple tabs**" is **disabled**

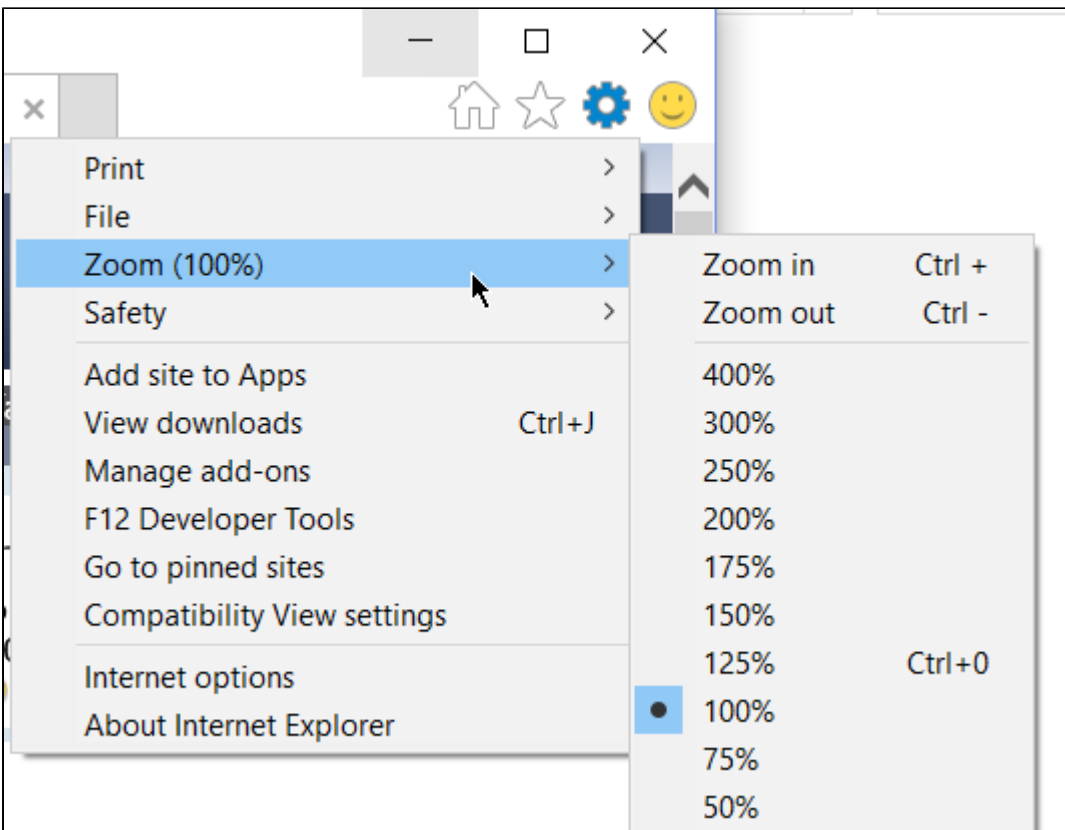

## Zoom Level

Switch to **Advanced** tab and **uncheck** the following options:

- Reset text size...
- Reset zoom level...

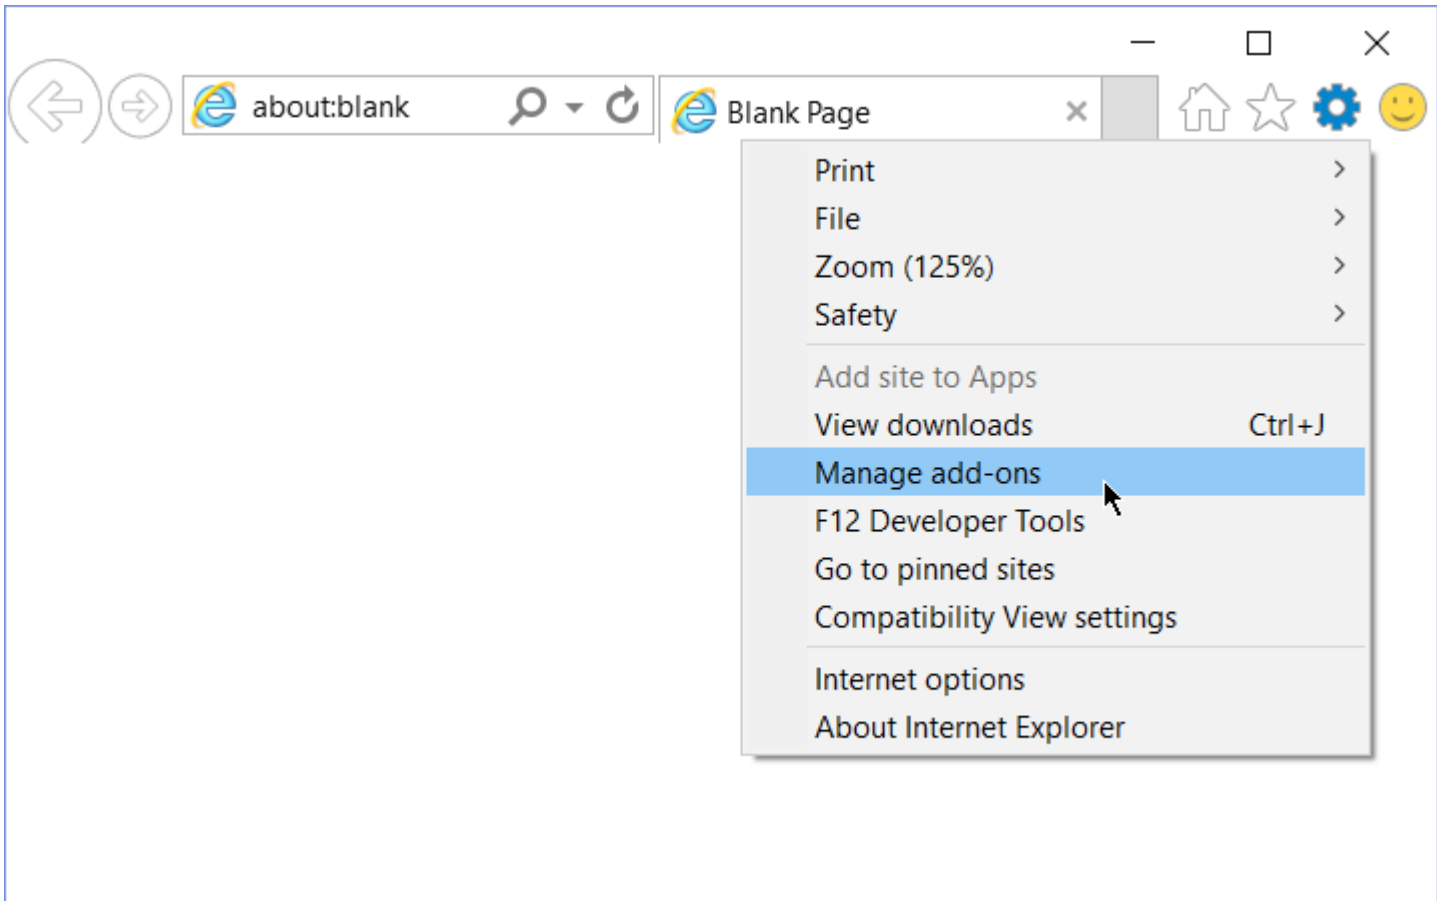

Afterwards, **set browser Zoom to 100%** and close Internet Explorer.

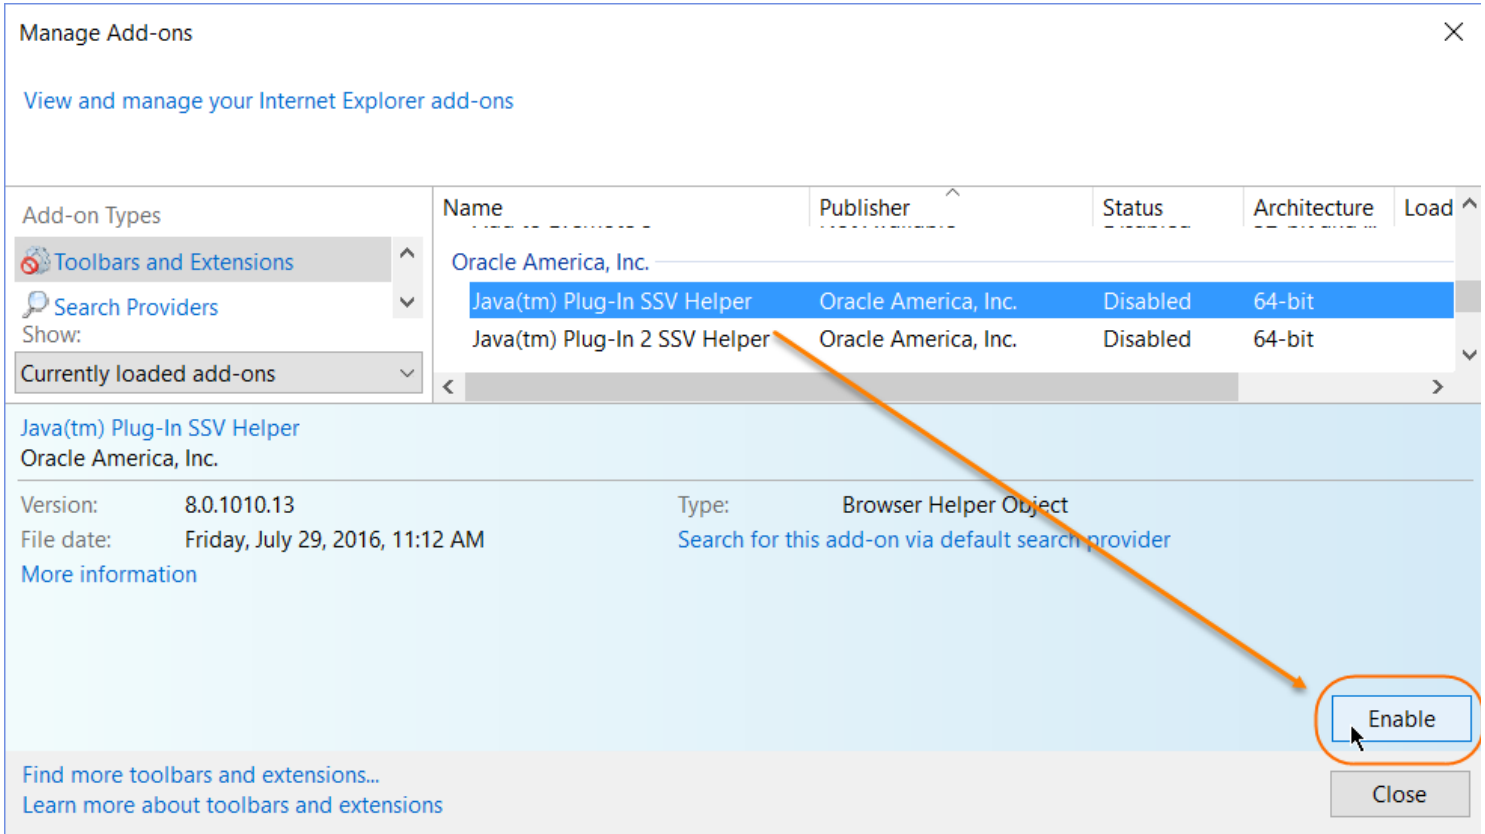

## Managing Java Add-ons

Open **Internet Explorer** browser, go to "**Tools**" and click on "**Manage Add-ons**":

In the opened popup window select **Toolbars and Extensions** menu item (on the left side) and find Java add-ons. If they are disabled, **enable Java add-ons**:

**If you don't have these Java add-ons** most likely you don't have java run-time environment in your system and you won't be able to run java applets inside browser.

In this case, refer to this guide and install java on your machine: <http://www.java.com/en/download/manual.jsp> - make sure you install Java x86/64 same as your Windows. After java is installed enable jIE ava add-ons described above.

If you see that **Java add-ons are enabled** but you are **not able to start any java applet** inside Internet Explorer, try to restart your machine.

## User Account Control Settings

Set User Access Control to the lowest level in **Control Panel > User Accounts > Change user Account Control settings**

The screenshot shows the Windows User Account Control Settings window. The left pane displays the 'User Accounts' control panel item, with a list of options including 'Change User Account Control settings' (marked with a red circle '1'). The right pane, titled 'User Account Control Settings', shows the 'Choose when to notify' slider. The slider is positioned at the bottom, labeled 'Never notify' (marked with a red circle '2'). The top of the right pane includes a link to 'User Account Control Tell me more about it'.
